⚠ WARNING

This service information is designed for experienced repair technicians only and is not designed for use by the general public. It does not contain warnings or cautions to advise non-technical individuals of potential dangers in attempting to service a product. Products powered by electricity should be serviced or repaired only by experienced professional technicians. Any attempt to service or repair the product or products dealt with in this service information by anyone else could result in serious injury or death.

When you note the serial number, write down all of the 11 digits. The serial number may be found on the unit.

Panasonic

IMPORTANT INFORMATION ABOUT LEAD FREE, (PbF), SOLDERING

If lead free solder was used in the manufacture of this product the printed circuit boards will be marked PbF.

Standard leaded, (Pb), solder can be used as usual on boards without the PbF mark.

When this mark does appear please read and follow the special instructions described in this manual on the use of PbF and how it might be permissible to use Pb solder during service and repair work.

1. ABOUT LEAD FREE SOLDER (PbF: Pb free)

Note:

In the information below, Pb, the symbol for lead in the periodic table of elements, will refer to

standard solder or solder that contains lead.

We will use PbF when discussing the lead free solder used in our manufacturing process which is made from Tin, (Sn), Silver, (Ag), and Copper, (Cu).

This model, and others like it, manufactured using lead free solder will have PbF stamped on the PCB. For service and repair work we suggest using the same type of solder although, with some precautions, standard Pb solder can also be used.

Caution

- PbF solder has a melting point that is 50° ~ 70° F, (30° ~ 40°C) higher than Pb solder. Please use a soldering iron with temperature control and adjust it to 700° ± 20° F, (370° ± 10°C). In case of using high temperature soldering iron, please be careful not to heat too long.
- PbF solder will tend to splash if it is heated much higher than its melting point, approximately 1100°F, (600°C).
- If you must use Pb solder on a PCB manufactured using PbF solder, remove as much of the original PbF solder as possible and be sure that any remaining is melted prior to applying the Pb solder.
- When applying PbF solder to double layered boards, please check the component side for excess which may flow onto the opposite side (See figure, below).

1.1. SUGGESTED PbF SOLDER

There are several types of PbF solder available commercially. While this product is manufactured using Tin, Silver, and Copper, (Sn+Ag+Cu), you can also use Tin and Copper, (Sn+Cu), or Tin, Zinc, and Bismuth, (Sn+Zn+Bi). Please check the manufacturer's specific instructions for the melting points of their products and any precautions for using their product with other materials.

The following lead free (PbF) solder wire sizes are recommended for service of this product: 0.3mm, 0.6mm and 1.0mm.

1.2. HOW TO RECOGNIZE THAT Pb FREE SOLDER IS USED

“PbF” is marked on the PCB to show that Pb free solder is used.(See the figure below.)

1.3. NOTE

Current models of the KX-TDA0170X use PbF. Early-production models do not.

2. FOR SERVICE TECHNICIANS

ICs and LSIs are vulnerable to static electricity.

When repairing, the following precautions will help prevent recurring malfunctions.

1. Cover the plastic parts boxes with aluminum foil.
2. Ground the soldering irons.
3. Use a conductive mat on the worktable.
4. Do not touch IC or LSI pins with bare fingers.

3. GENERAL DESCRIPTION

This card, which is used in the free slot of the TDA system, can randomly connect eight of SLT, DPT, and APT. In DPT connection, the XDP function allows SLT to be connected to each port in parallel. It is comprised of CPU that is SH-1 (SH7020), 8Mbit flash ROM, and 2Mbit SRAM. The software updates can be downloaded.

4. SPECIFICATION

Functional Block	Functional contents	
Extension Interface	Number of Ports	8 ports
	PT Interface	+40V/+15V Overcurrent protective function, Volta switching function Inter-APT communications D (Upward: 0.25kbps, Downward: 0.69kbps) 2W Ping-pong transmission system (31.25kbps) Inter-DPT communications, Inter-CS (TDA0141) communications (from ver.1.1) 2B+D (144kbps) 2W Ping-pong transmission syst (512kbps) Dch-control HDLC embeds eight channels in ASI Surge protective function
	SLT Interface	+30V 30mA Feeding function Dial-pulse signal detecting function DTMF signal detecting function Bell signal issuing function Hook detecting function Ringtrip detecting function 2W/4W converting function Surge protective function Infineon-manufactured 4ch codec function CODEC function μ /A law switching function Test function (Loop back, Tone generation) Programmable digital filtering function Serial interface function PIO function
DTMF Receiver	Eight lines for each port	
Extension Caller ID	Only connector terminal is installed	
On-board Ringer	20/25Hz 75Vrms Phase control (Three-phase / Four-phase)	
On-board DC/DC Power Supply	Input +15V Output +15V, +5V, +3.3V	
Power Failure Forwarding Function	Two lines supported	
Self-Diagnostic Function	Carried out with outside-line interface in a pair (DHLC8 card has only Speech path test, Dial pulse test, DTMF test)	
ASIC	EC bus interface function CT bus interface function, Digital PLL function Local bus interface function Time switch function, Gain controlling function, DPRAM function Private telephone controlling interface function Parallel IO function	

Functional Block	Functional contents	
Controller	CPU	SH-1/SH7020 (12.288MHz)
	Flash ROM	1 Mbyte
	SRAM	256 kbyte
LED Display Circuit	Card status indicating LED: Two colors (Red/Green)	
External Interface Connector	Extension interface	50pin Amphenol connector: 1
	Power failure forwarding	4pin modular jack: 1

5. NAMES AND LOCATIONS

Overview

Inside View

Note:

*Null slot is not available for any optional service cards.

5.1. INSTLLING/REMOVING THE OPTIONAL SERVICE CARDS

Slot Condition

Card Type	Slot Type		
	KX-TDA100: Free Slots 1 to 5 KX-TDA200: Free Slots 1 to 10	Option Slot	MPR Slot
MPR Card	No	No	Yes
CO Line Cards	Yes	No	No
Extension Cards	Yes	No	No
OPB3 Card	Yes	Yes	No
CTI-LINK Card	Yes	Yes	No

Caution:

To protect the back board from static electricity, do not touch parts on the back board in the main unit and on the optional service cards. To discharge static, touch ground or wear an earthing strap.

DHLC8 Card

Function

8-port digital hybrid extension card for DPT, APT, SLT, and digital DSS consoles with 2 power failure transfer ports.

Notes

- To connect the amphenol connector, refer to "Fastening Amphenol Type Connector".

- **For details about power failure transfer, refer to "Auxiliary Connection for Power Failure Transfer".**

Accessory and User-supplied Items

Accessory: screws x 2

User-supplied: amphenol connector

LED Indications

Indication	Color	Description
CARD STATUS	Green/ Red	OFF: Power Off Green ON: Normal (all ports are idle) Green Flash (60 times per minute): Normal (a port is in use) Red ON: Fault (includes reset) Red Flash (60 times per minute): Out of Service

Fastening Amphenol Type Connector

An amphenol 57JE type connector is used on some of the optional service cards.

To connect an amphenol connector, use the spring latch or screw to fix the upper part and use Velcro® tape to fix the lower part of the connector.

Auxiliary Connection for Power Failure Transfer

When the power supply to the Hybrid IP-PBX fails, power failure transfer (PFT) switches the current connection to the Auxiliary Connection automatically. A specific SLT (determined by System Programming) will be connected to selected CO lines in the event of system power failure. Auxiliary Connection is required to implement this feature.

Connection

The following CO line and extension cards can be used for Auxiliary Connections:

- Analog CO line cards: LCOT16 (4 PFT ports), and LCOT8 (2 PFT port)
- Extension cards: MSLC16 (4 PFT ports), SLC16 (4PFT ports), DHL8 (2 PFT port) and SLC8 (2 PFT port)

Note

Pin assignments for ports 3 and 4 are the same as those of ports 1 and 2.

Accessory and User-supplied Items

Accessory: none

User-supplied: RJ11 connectors

RJ11 Connector Pin Assignments for CO line Crad

	No.	Signal Name	Function
	1	R2	Ring port 2
	2	R1	Ring port 1
	3	T1	Tip port 1
	4	T2	Tip port 2

RJ11 Connector Pin Assignments for Extension Card

	No.	Signal Name	Function
	1	T2	Tip port 2
	2	T1	Tip port 1
	3	R1	Ring port 1
	4	R2	Ring port 2

Installing Optional Service Cards

1. Insert the card along the guide rails.

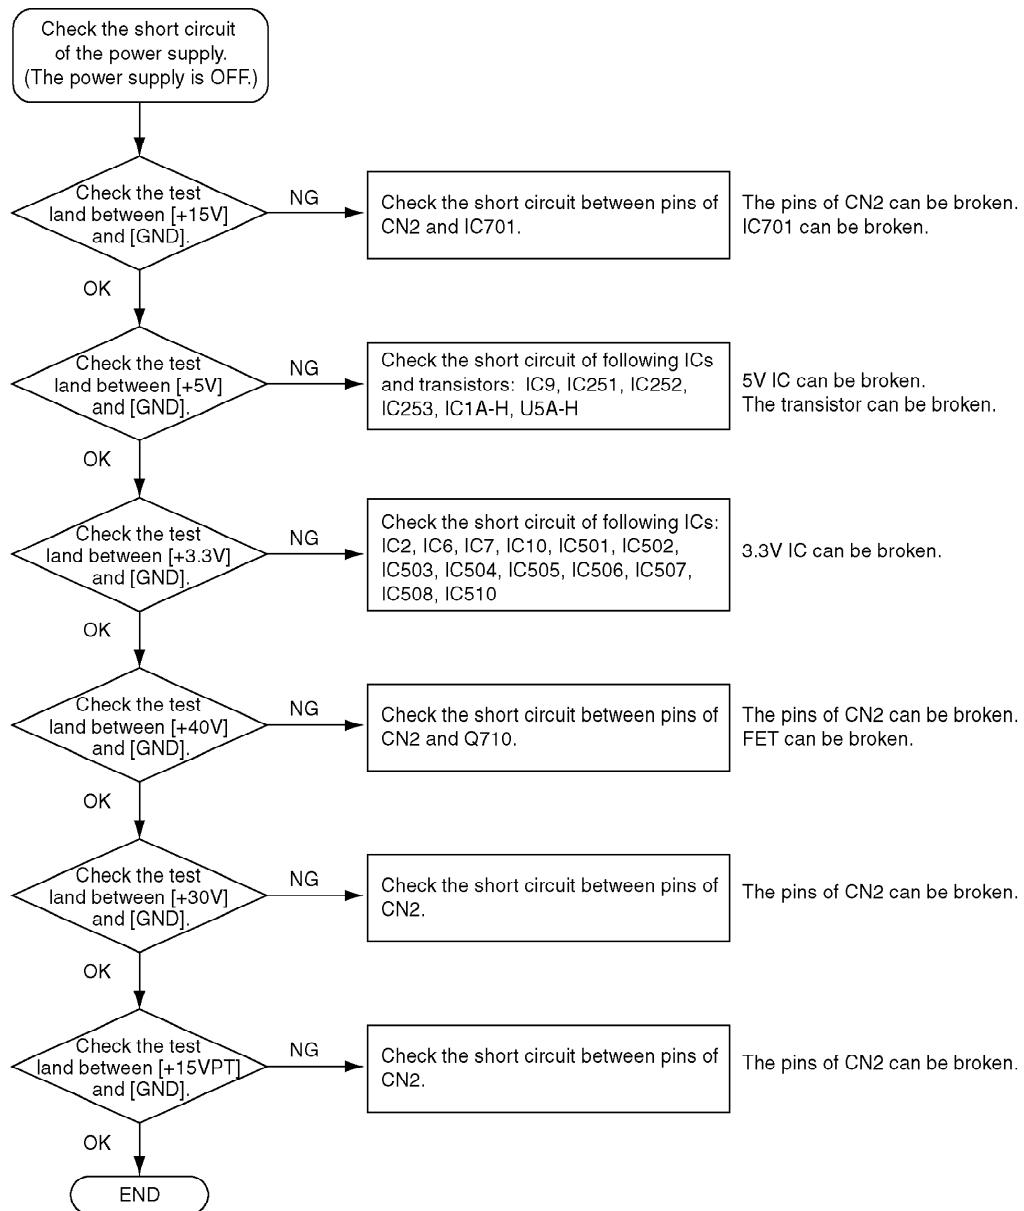

2. Holding the card as follows, push the release lever in the direction of the arrow so that the card is made to engage with the connector on the back board securely.

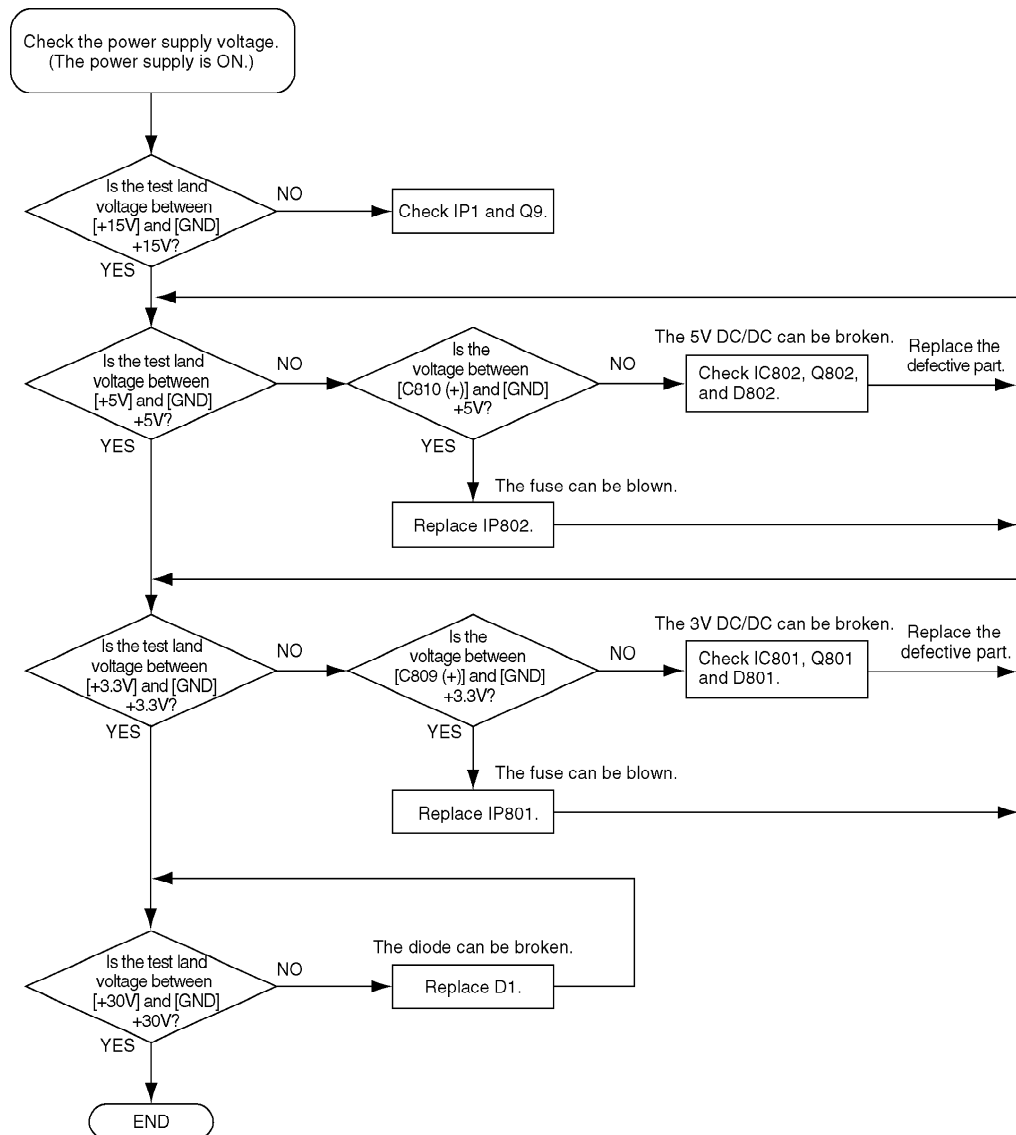

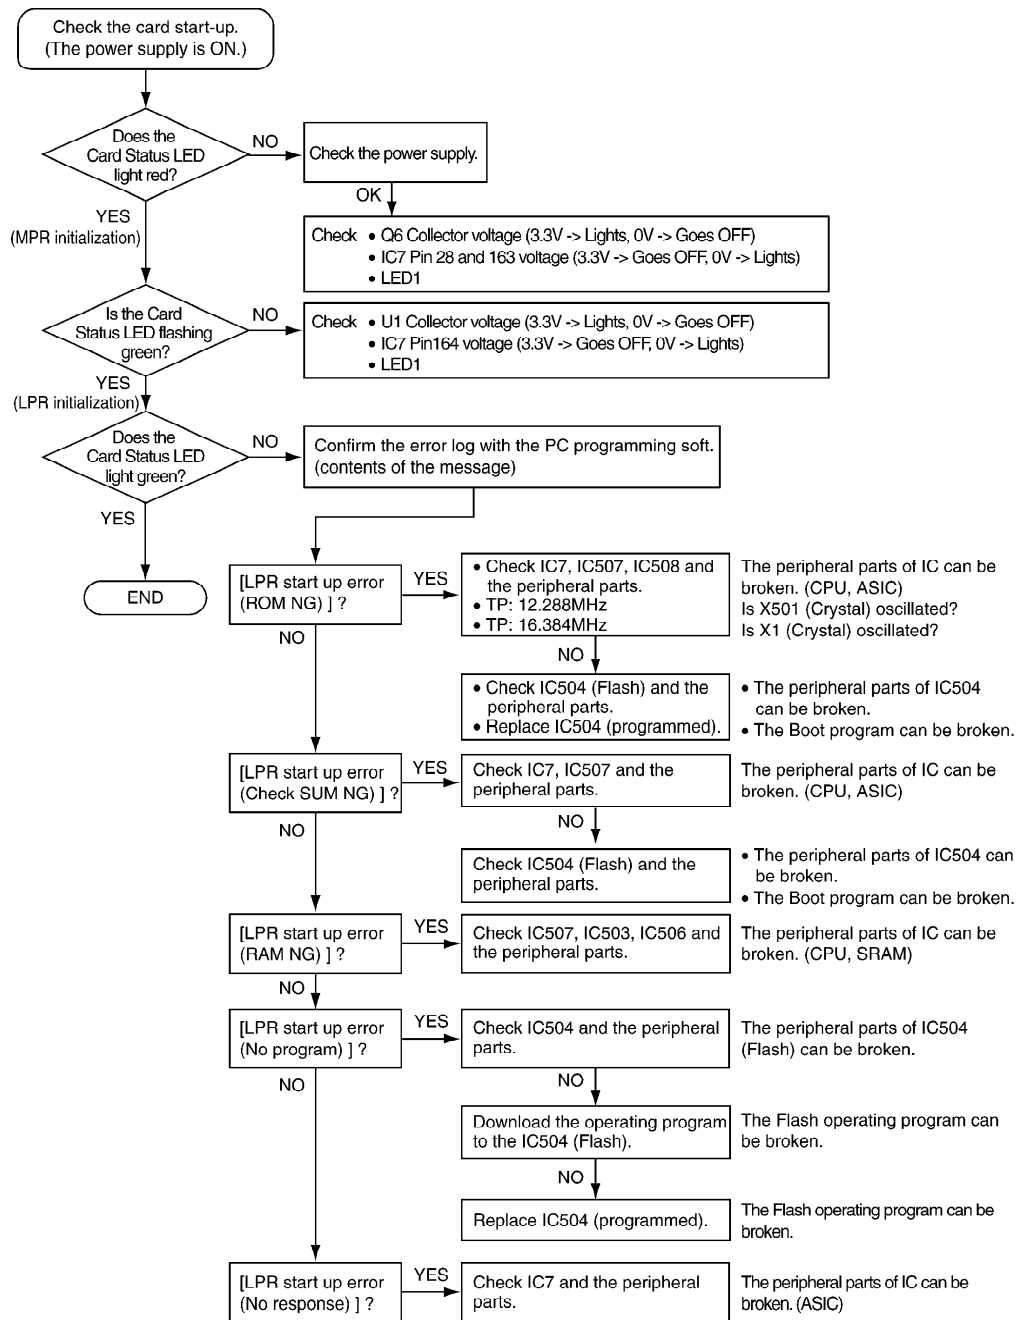

3. Turn the 2 screws clockwise to fix the card.

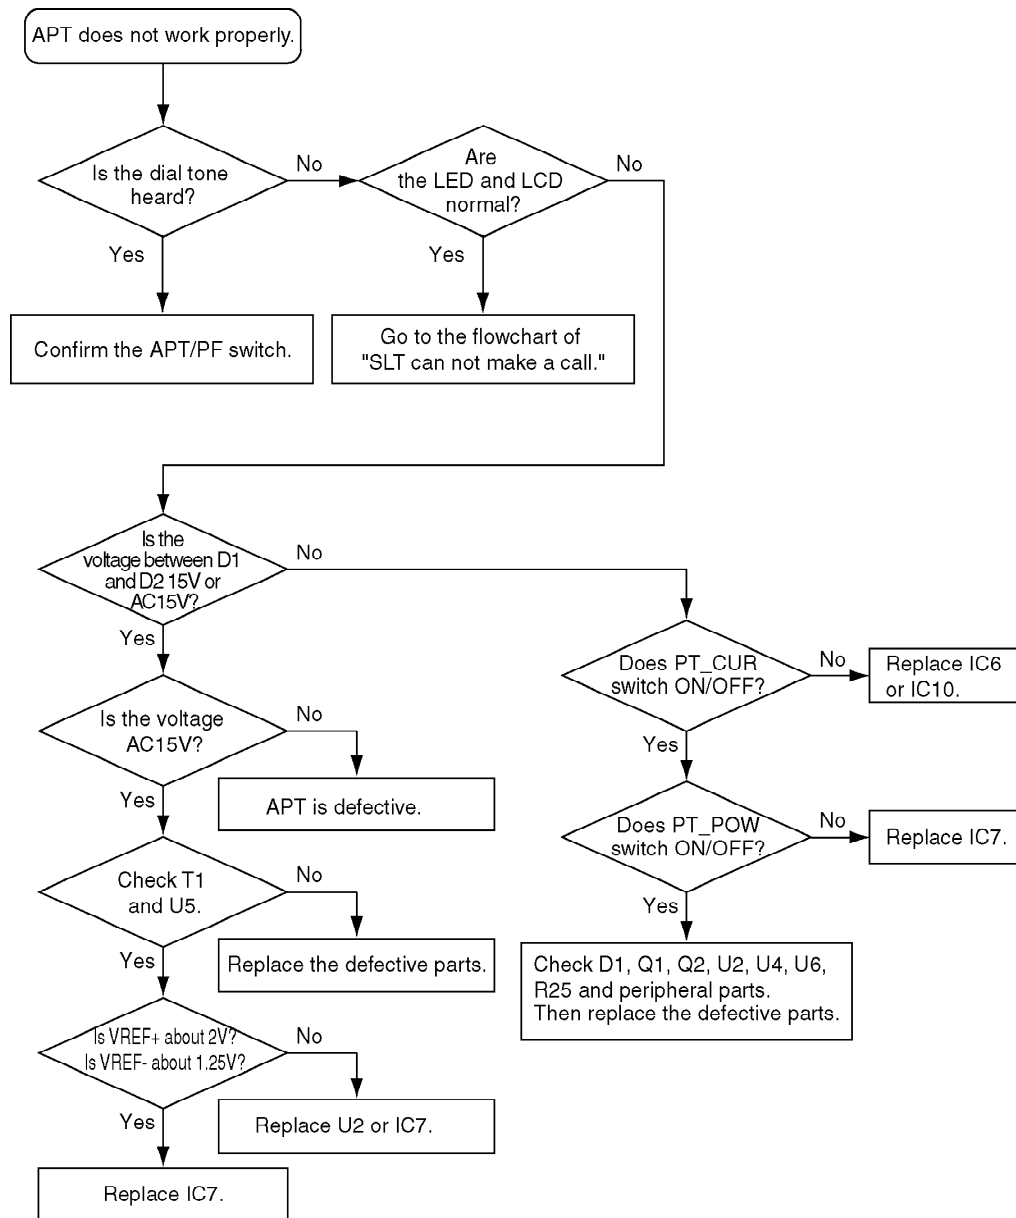

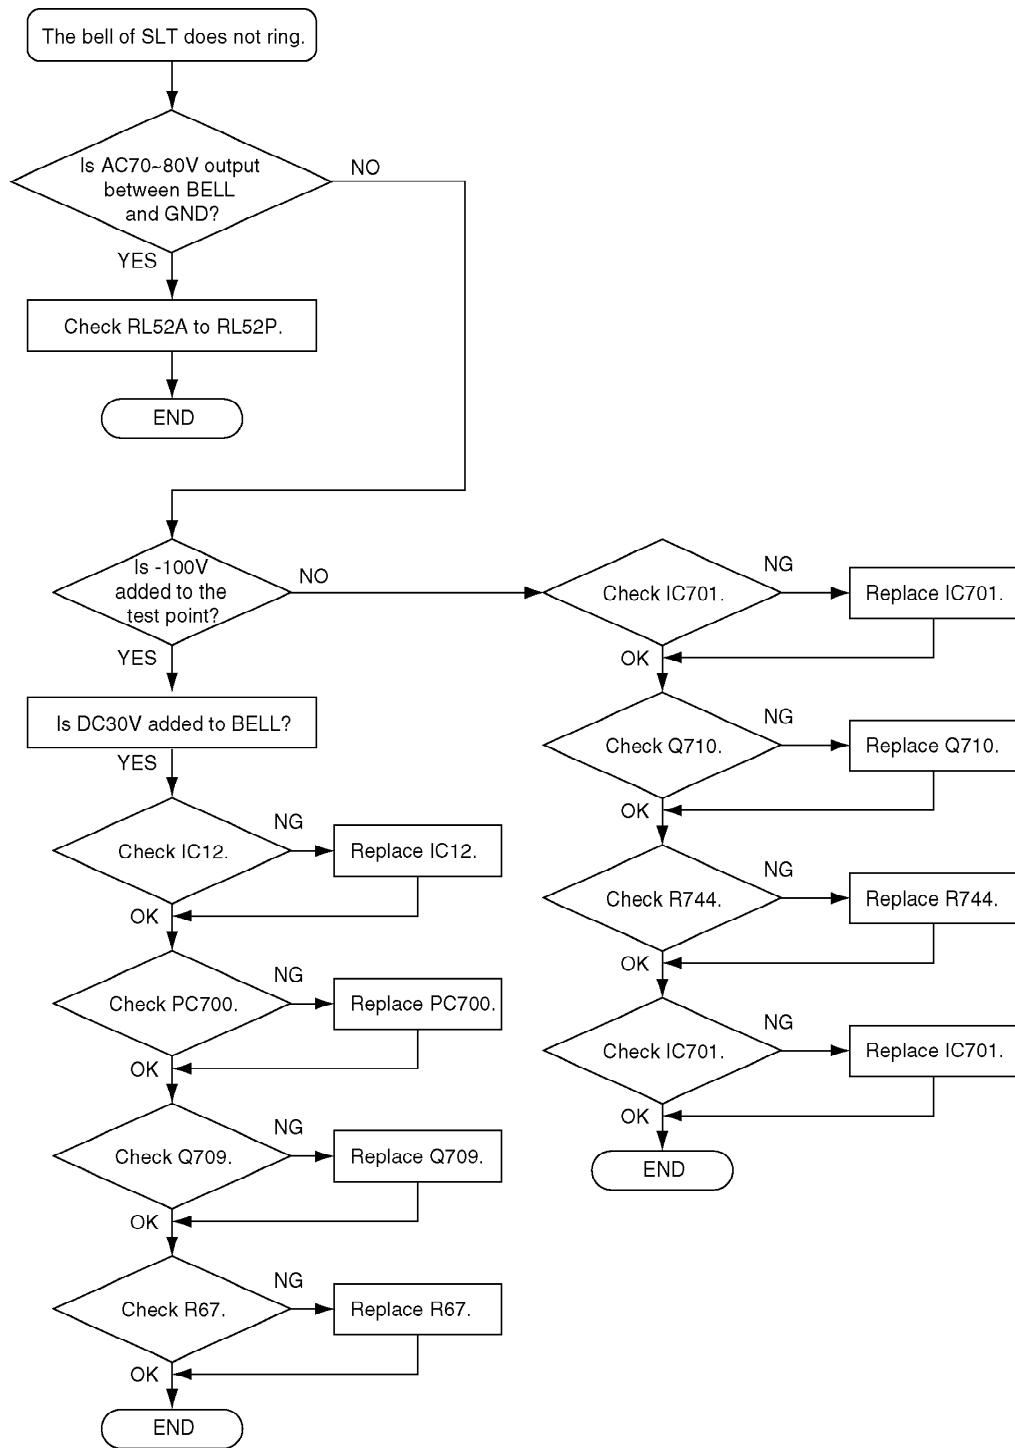

6. TROUBLESHOOTING GUIDE

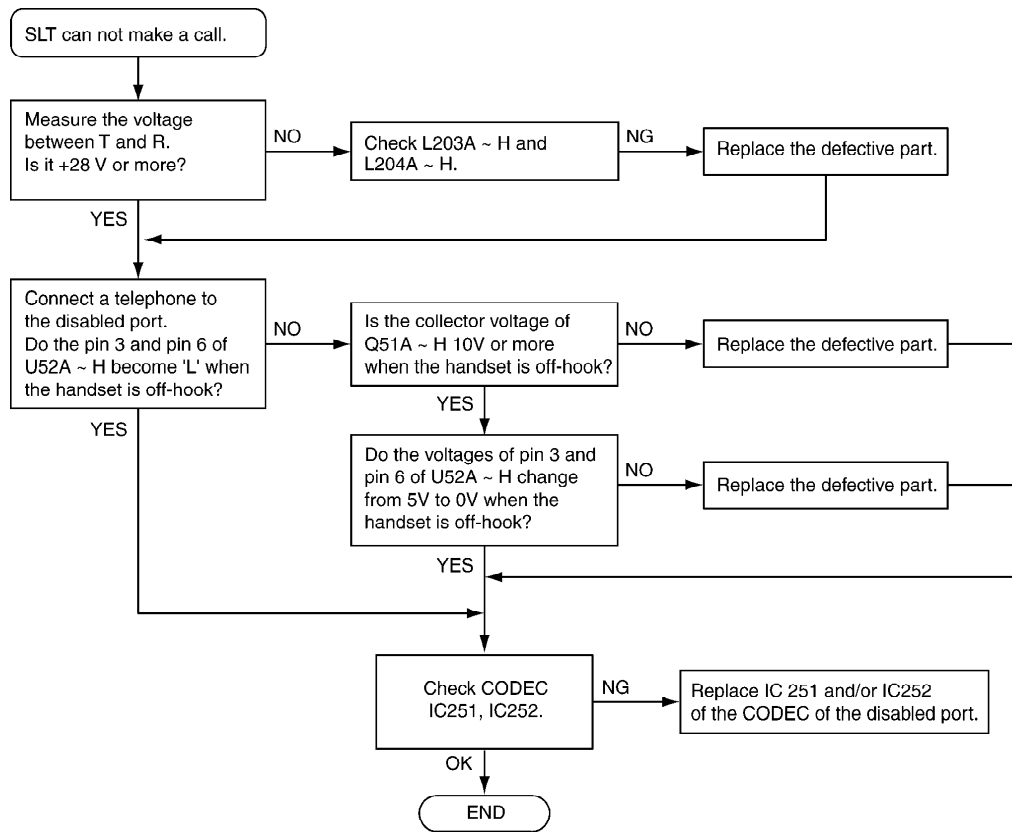

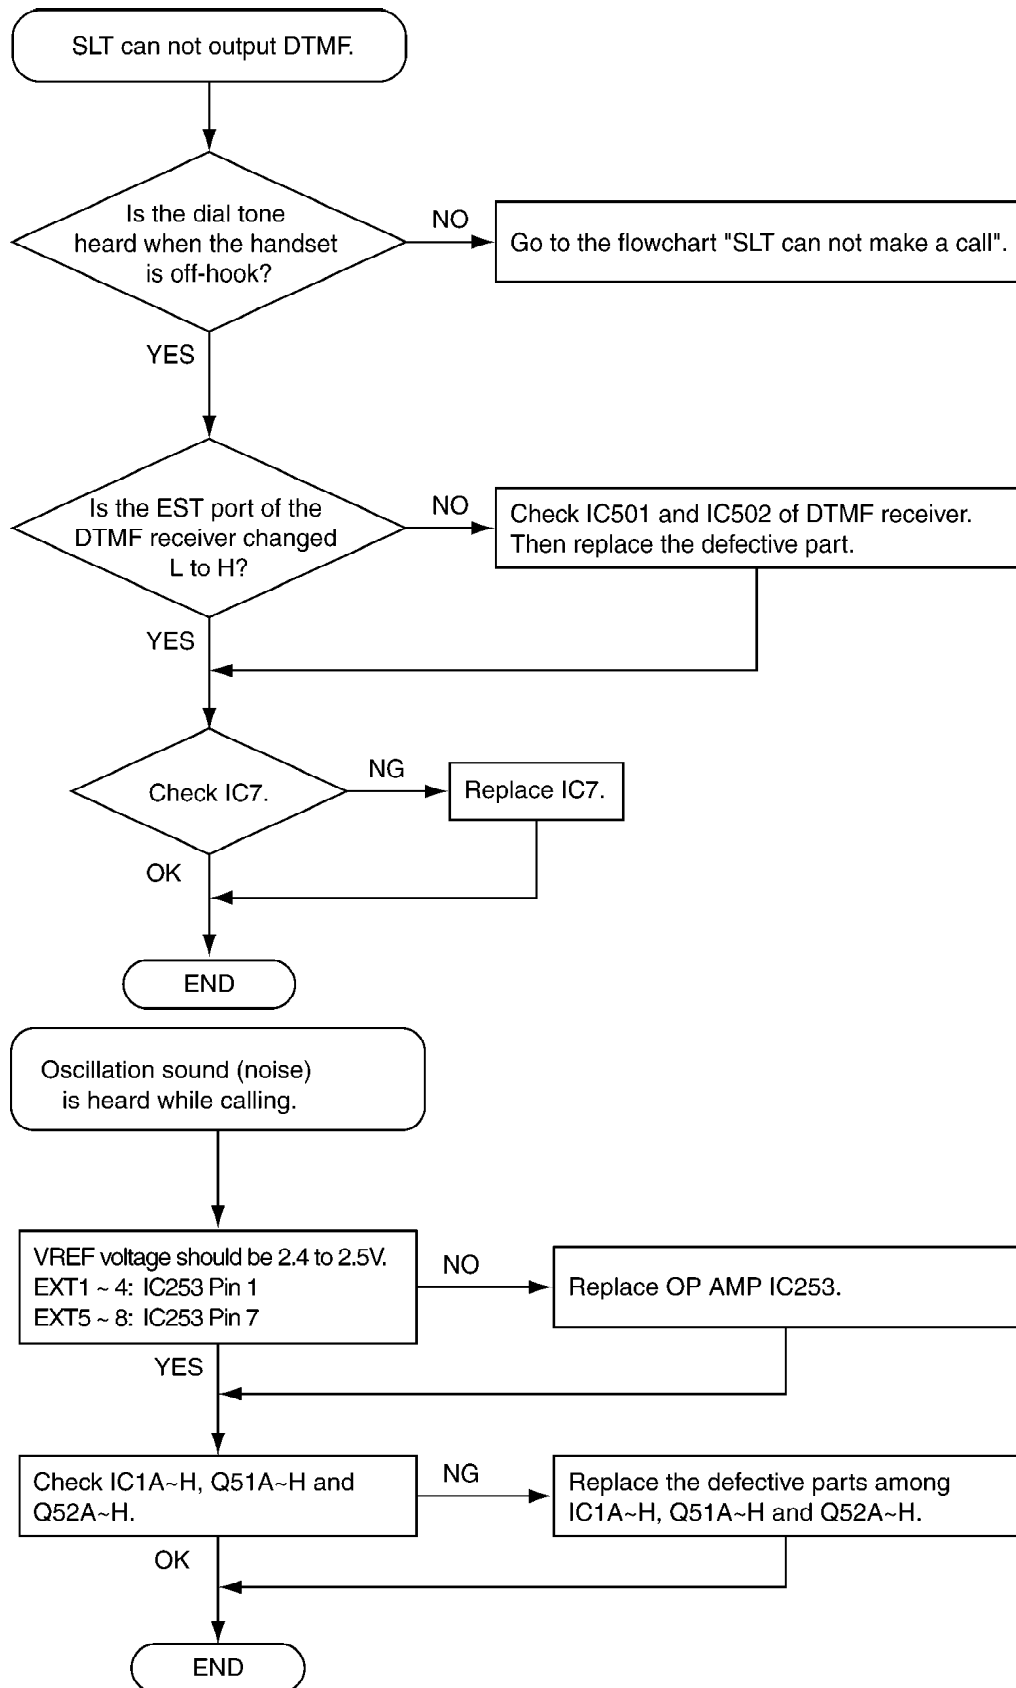

7. BLOCK DIAGRAM

8. CIRCUIT OPERATION

8.1. Contol-System Circuit

8.1.1. CPU Peripherals

- CPU (System clock: 12.288 MHz).....IC507

Data bus: 16bit, Address bus: 23bit

- Flash ROM (8Mbit).....IC504

Flash memory consists of two areas: boot space and administration space.

administration program can be rewritten through downloading.

0	Sector 0	16KB	Boot (128KB)
4000	Sector 1	8KB	
6000	Sector 2	8KB	
8000	Sector 3	32KB	
10000	Sector 4	64KB	
20000	Sector 5	64KB	Administration (896KB)
30000	Sector 6	64KB	
40000	...		
F0000	Sector 18	64KB	

- SRAM (2Mbit).....IC503, IC506

Used for the data buffer for CPU work area, and PT communication.

- Dual port RAM (128byte).....Uses a part of the functions of IC7.

Used for the buffer for the communications with MPR.

- Reset

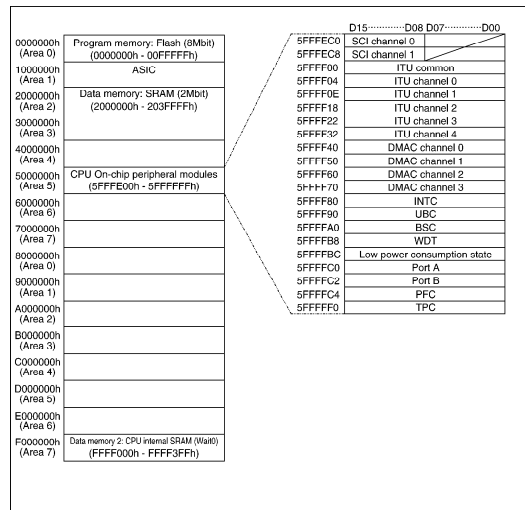

On boot-up, ASIC reset release is carried out by EC_nRST from MPR. After the ASIC reset release, CPU reset is released by the soft reset release from MPR; then, LPR program starts up.

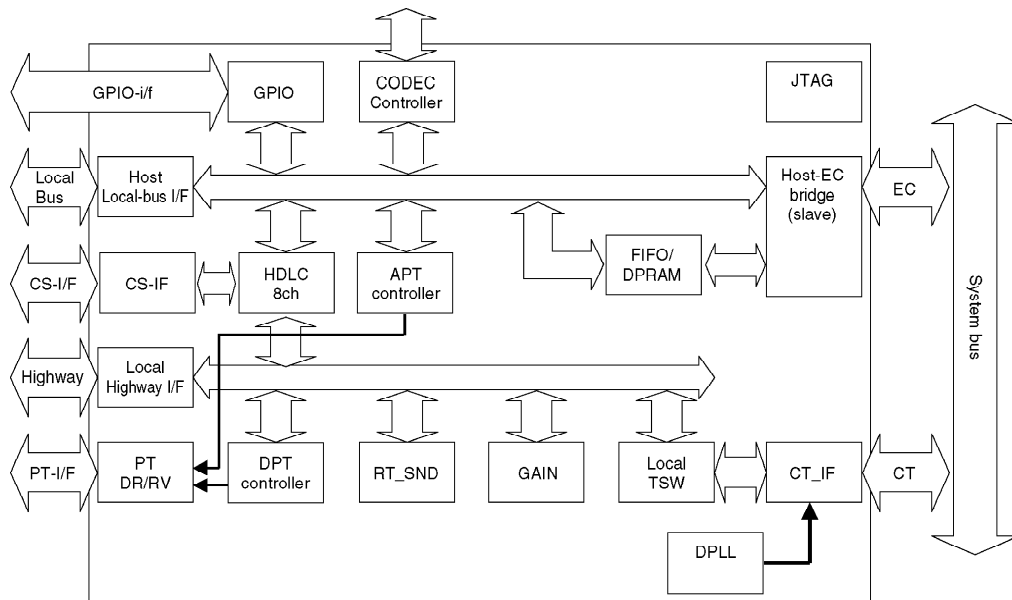

- Operation in instantaneous interruption

When instantaneous power interruption is 300msec or less, reset operation is not carried out because the voltage is retained by the capacitor in the power supply. However, for the purpose of reducing the power consumption during instantaneous interruption, if it is detected (nHALT=L), power down mode is established and CPU itself goes into sleep mode. CPU sleep is

- recovered from by the edge detection of nIRQ0 → L.
- LED Operation status indicating LED (Two colors)
 - Red ON: Fault (RESET included)
 - Green ON: INS (Line not in use)
 - Green Flash (60/minute): INS (Line in use)
 - Red blinking: OUS
 - OFF: Power supply failure
- Address map

8.1.2. IC7 (ASIC)

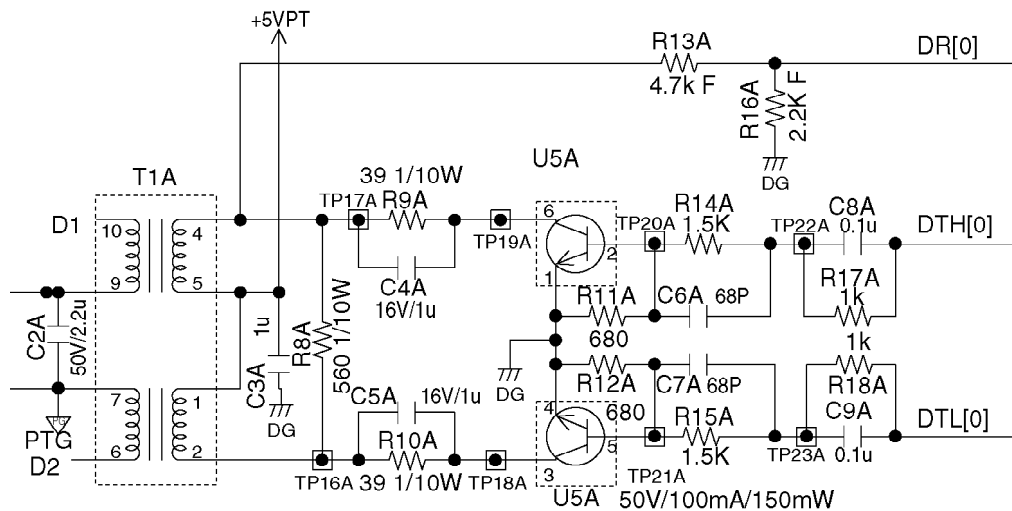

- EC bus interface
 - Independent bus for 16bit/8MHz two-way address data multiplex.
- CT bus interface
 - Supports eight 8.192MHz highways (128 time slots).

- **Local bus interface**
HITACHI-manufactured (Data 8bit, Address 13bit) SH-1CPU-compatible bus.
- **Local highway interface**
Accommodates 2.048, 4.096, and 8.192MHz highways (Up to 64 time slots).
- **Local TSW**
Exchanges the time slots between CT bus (1024ch) and local highway (64ch).
- **Local gain control**
Controls the gain of the local highway up-and-down 64ch in 1db step arbitrarily.
- **PT interface**
Allows APT/DPT interface to be selected for each port.
- **CODEC interface**
Can connect up to four Infineon-manufactured PEB2466, and is intended for enabling the line control.
- **GPIO interface**
Parallel interface that is arbitrarily programmable bidirectionally.
- **Time slot structure**
The following is the time slot structure of the local highway on TDA0170.

Slot	PCM data	Slot	PCM data
0	DPT#0 B1	16	SLT#0
1	DPT#0 B2	17	SLT#1
2	DPT#1 B1	18	SLT#2
3	DPT#1 B2	19	SLT#3
4	DPT#2 B1	20	SLT#4
5	DPT#2 B2	21	SLT#5
6	DPT#3 B1	22	SLT#6
7	DPT#3 B2	23	SLT#7
8	DPT#4 B1	25 ~ 26	Not used
9	DPT#4 B2		
10	DPT#5 B1		
11	DPT#5 B2		
12	DPT#6 B1	63	Reserved
13	DPT#6 B2		
14	DPT#7 B1		
15	DPT#7 B2		

8.2. Line-System Circuit

8.2.1. PT Interface

- APT data communications

Control data is transmitted from the DTL terminal of ASIC, then is output to APT (between D1 and D2) by way of the driver U5 and the pulse transformer T1.

The control data transmitted from APT is input to the DR terminal of ASIC by way of the pulse transformer T1 and R13. ASIC compares VREF+ with the input waveform, and receives a valid pulse.

- DPT data communications

Bch/Dch/Cch data is transmitted from the DTL/DTH terminal of ASIC, and the AML-converted pulse signal is output to DPT (between D1 and D2) by way of the driver U5 and the pulse transformer T1. The Bch/Dch/Cch data transmitted from APT is input to the DR terminal of ASIC by way of the pulse transformer T1 and R13. ASIC compares VREF+ and VREF- with the input waveform, and receives a valid pulse.

- Bch communications

Communicated by the PCM data (64kbps × 2) connected from the local highway by ASIC.

Used mainly for the audio signal of DPT.

- Dch communications

Communicated by the data (16kbps) protocol-converted by the

HDLC controller in ASIC.

Used mainly for the control signal of DPT.

- Cch communications

Communicated by the data (8kbps) converted by the serial/parallel-converting circuit in ASIC.

Used mainly for recognizing the terminal model.

- PT current-supply circuit

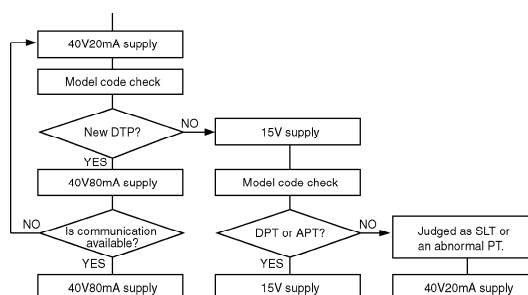

+15V/+40V is superimposed on the transmit/receive data line (D1, D2), and fed to PT. Supply voltage is +15V for old DPT and APT, and +40V for new DPT. It will be switched after the connected PT is judged through communications. I/O control is as follows.

PT_POW	PT_CUR	
H	H	15V
H	L	0V
L	H	40V80mA
L	L	40V20mA

For the protection against such as an overcurrent owing to +15V short in wiring, 300mA constant-current circuit by Q1, Q2, and R25 is used. In case of +40V, 20mA and 80mA constant-current circuits by Q4, U3, R7, and R27 are used.

The following is the flow chart of telephone switching at boot-up.

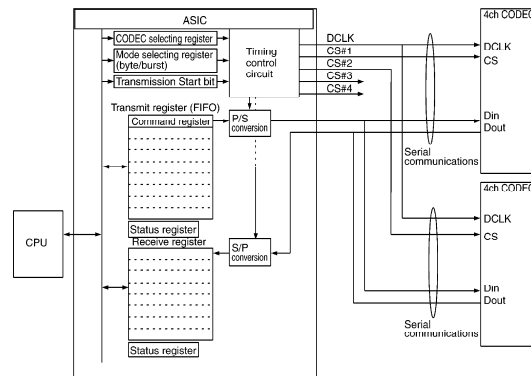

8.2.2. SLT interface

- CODEC control.....IC251, IC252

Infineon-manufactured PEB2466 is used. The analog characteristics, such as BN, frequency characteristic, level, and sidetone, are set by the CODEC interface DCLK, CS, DOUT, and

The conversion of 4-line analog signal and G.711 format PCM code (μ /A) is carried out.

The feeding current is limited to 30mA by the circuit configurations of R59, Q53, R60, and Q54.

Switching relays RL251 and RL252 are on board in order that two lines out of eight can be directly connected to the outside line in case of power failure. They will be directly connected to the line

that is connected with the outside-line card connected by CN4 on the front of the board and 4-conductor TEL cord. In normal operation, the switching relays are in 'make' state. In case of power supply down, they will be in 'break' state, and the power-failure direct-dial mode will be established.

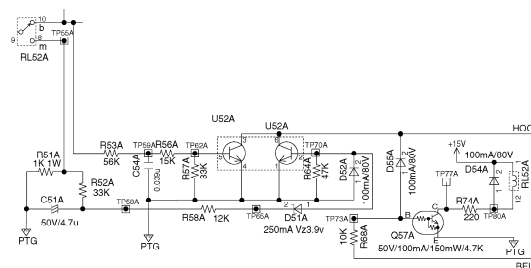

- Self-diagnostic relay

A port has a self-diagnostic relay. In normal operation, the self-diagnostic relay is in 'break' state. In self-diagnostic operation, it will be in 'make' state. In self-diagnostic mode, Tip-Ring will be connected to Tip-Ring of another outside-line card by way of the backboard, and the self-diagnosis of the outside-line card can be carried out.

The self-diagnosis of the outside-line card includes outside line acquisition, dial pulse issue, DTMF issue, BELL reception, and CPC detection.

- Bell signal issuing circuit

When feeding and speech paths are connected, BELL relay will be in 'break' state. When the bell signal is issued, BELL relay will be in 'Make' state.

- HOOK detecting circuit

When BELL signal is not output or when dial pulse is received, this circuit distinguishes whether SLT is off hook or on hook. When SLT is off hook, DC loop is formed and current flows into U52. At this time, the collector of U52 (3, 4, and 5 pin), namely, HOOK signal changes from H to L and is detected by CPU by way of CODEC → ASIC. When SLT is on hook, DC loop is interrupted and the current flow into U52 (3, 4, and 5 pin) ceases; the collector of U52, namely, HOOK signal changes from L to H and is detected by CPU in like manner.

- Ring trip circuit

While BELL signal is output, this circuit detects SLT off-hook by

the hardware, and makes BELL relay in 'break' state.

While BELL signal is issued, when SLT is on hook, U52 (1, 2, and 6 pin) is off. When SLT is taken off the hook, DC loop is formed because 30V is superimposed on BELL signal; then, current flows into R52 → R58 → D51 → U52, and U52 (1, 2, and 6 pin) becomes on.

When U52 (1, 2, and 6 pin) has become on, because the base of Q57 that is the driver of BELL relay becomes L, BELL relay will be in 'break' state and SLT current-supply circuit feeds current to SLT.

- DTMF signal detecting circuit

Each port has its DTMF receiver.

Ports A to D carry out detection at IC501, and ports E to H do that at IC502.

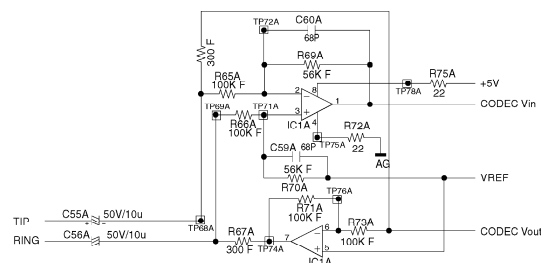

That DTMF data has become valid at EST terminal = H is detected by CPU by way of CODEC → ASIC, and then CPU reads and detects the data of DTMF receiver.

- 2W-4W converting circuit

This circuit converts between the 2-line audio signal of APT or SLT and the 4-line audio signal on CODEC.

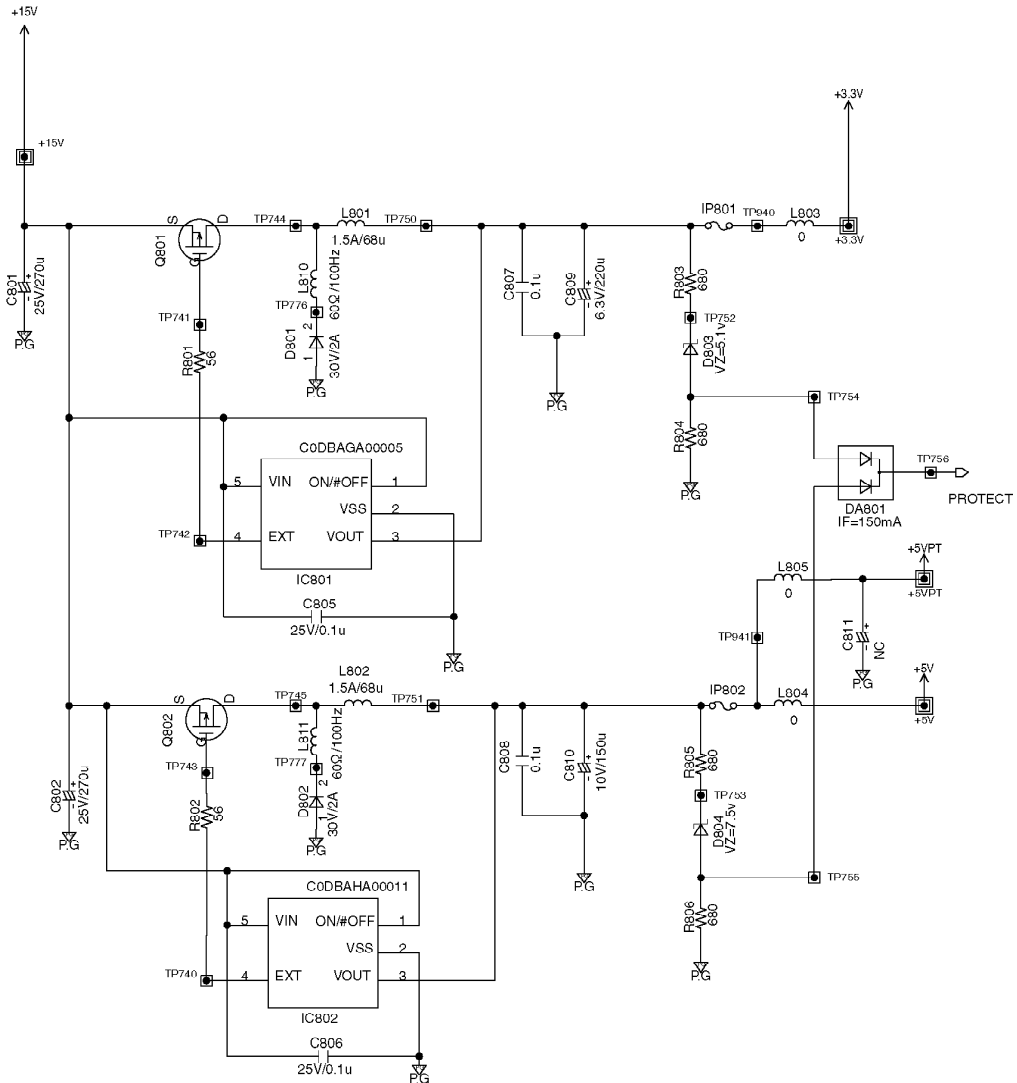

The audio signal from SLT is input to the differential amplifying circuit of IC1 (1, 2, and 3 pin) by way of C55 and C56, and its output is input to CODEC.

CODEC output is issued to SLT in the form of the synthesis of the signal that is output through by way of R63 and the one that is reversely output by IC1 (5, 6, and 7 pin). Programmable frequency characteristic adjusting filter, sidetone removing filter, and return loss compensating filter are included in CODEC.

8.3. Power Supply Circuit

8.3.1. DC/DC Converting Circuit

This circuit generates +3.3V, +5V from the input +15V.

It is comprised of the circuit that steps +15V down to +3.3V by the switching power supply of IC801, Q801, and L810 and the one that steps +15V down to +5V by the switching power supply of IC802, Q802, and L811.

It has three protection circuits: IP801 against +3.3V short, IP802 against +5V short, and the overvoltage protection that detects the voltage buildup of +3.3V/+5V, turns FET of Q9 on, and then interrupts IP1.

8.3.2. Ringer Generating Circuit

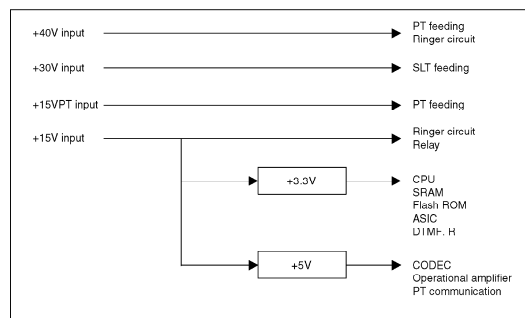

The bell signal forms a sine wave out of the rectangular wave of 20/25Hz transmitted from ASIC of MPR, amplifies it up to AC75Vrms, and generates it.

+40V is stepped up to +180V and -100V by SW power circuit that oscillates at 200KHz, and the voltage between these is amplified with a focus on +30V to generate the bell signal of AC75Vrms.

8.3.3. Power Supply System

Power-supply input includes four systems: +15V, +15VPT, +40V, and +30V; the output includes +15V, +5V, +3.3V, +40V.

10. HOW TO REPLACE THE FLAT PACKAGE IC

If you do not have the special tools (for example: SPOT HEATER) to remove the SPOT HEATER'S Flat IC, If you have solder (large amount) a soldering iron and a cutter knife, you can easily remove IC's even though large than 100 pin.

10.1. PREPARATION

10.1.1. Pb Solder

- SOLDER

Sparkle Solder 115A-1, 115B-1 or Almit Solder KR-19, KR-19RMA

- Soldering Iron

Tip Temperature of 662 ± 50°F (350 ± 10°C)

Note: We recommend a 30 to 40 Watt soldering iron. An expert may be able to use a 60 to 80 Watt iron where someone with less experience could overheat and damage the PCB foil

- Flux

Recommended Flux: Specific Gravity → 0.863.
(Original flux should be replaced daily.)

10.1.2. PbF Solder

- Soldering Iron

Tip Temperature of 700°F ± 20°F (370°C ± 10°C)

Note: We recommend a 30 to 40 Watt soldering iron. An expert may be able to use a 60 to 80 Watt iron where someone with less experience could overheat and damage the PCB foil.

- Flux

Recommended Flux: Specific Gravity → 0.82.

Type → RMA (lower residue, non-cleaning type)

Note: See [ABOUT LEAD FREE SOLDER \(PbF: Pb free\) \(\)](#).

10.2. PROCEDURE

- 1. Tack the flat pack IC to the PCB by temporarily soldering two diagonally opposite pins in the correct positions on the PCB.**

● — — — — — Temporary soldering point.

Be certain each pin is located over the correct pad on the PCB.

- 2. Apply flux to all of the pins on the IC.**

3. Being careful to not unsolder the tack points, slide the soldering iron along the tips of the pins while feeding enough solder to the tip so that it flows under the pins as they are heated.

10.3. REMOVING SOLDER FROM BETWEEN PINS

1. Add a small amount of solder to the bridged pins.
2. With a hot iron, use a sweeping motion along the flat part of the pin to draw the solder from between the adjacent pads.

11. TERMINAL GUIDE OF ICS, TRANSISTORS AND DIODES

A	XYN3+F6	 Φ 3 x 6 mm
B	XSN4X40+6FN	 Φ 2.8 x 6 mm

13. ACCESSORIES AND PACKING MATERIALS

14. REPLACEMENT PARTS LIST

1. RTL (Retention Time Limited)

Note: The marking (RTL) indicates that the Retention Time is limited for this item.

After the discontinuation of this assembly in production, the item will continue to be available for a specific period of time. The retention period of availability is depends on the type of assembly, and in accordance with the laws governing parts and product retention.

After end of this period, the assembly will no longer be available.

2. Important safety notice

Components identified by \triangle mark have special characteristics important for safety. When replacing any of these components, use only manufacture's specified parts.

3. The S mark means the part is one of some identical parts. For that reason, it may be different from the installed part.

4. ISO code (Example: ABS-94HB) of the remarks column shows quality of the material and a flame resisting grade about plastics.

5. RESISTORS & CAPACITORS

Unless otherwise specified;

All resistors are in ohms (Ω) K=1000 Ω , M=1000k Ω

All capacitors are in MICRO FARADS (μ F) P= μ μ F

15. FOR SCHEMATIC DIAGRAM

Note:

1. DC voltage measurements are taken with voltmeter from the negative voltage line.

Important Safety Notice:
Components identified by  mark have special characteristics important for safety. When replacing any of these components, use only the manufacturer's specified parts.

2. This schematic diagram may be modified at any time with the development of new technology.
